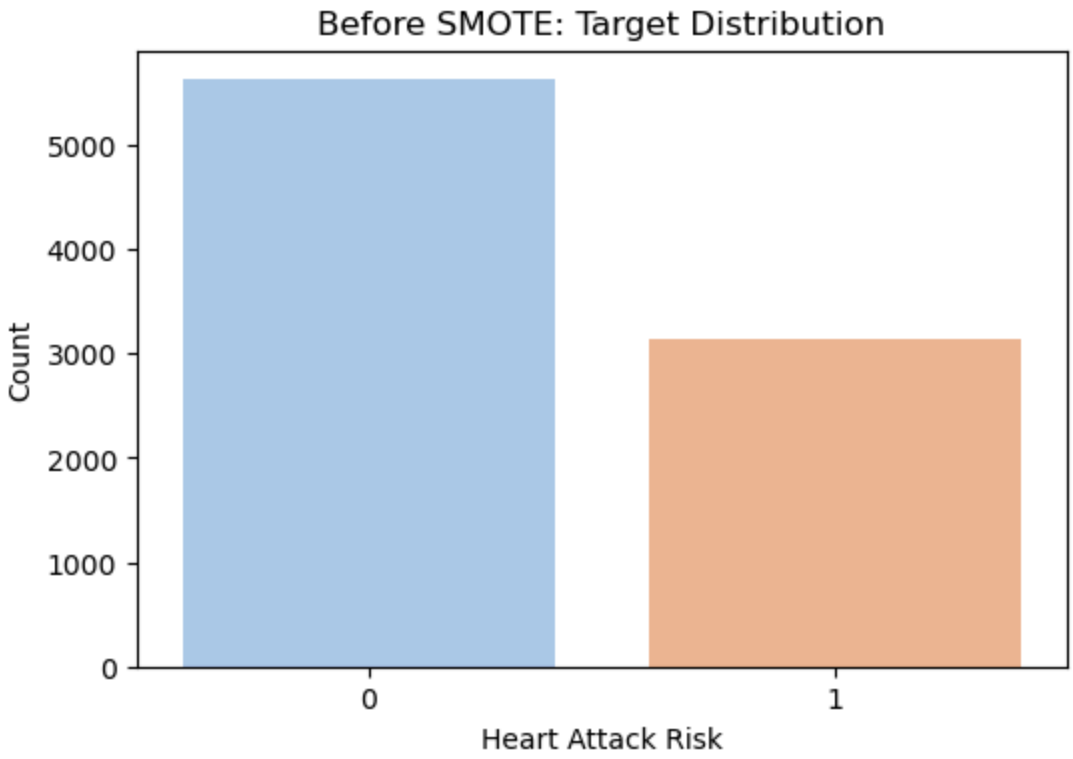
Apply SMOTE and Visualize Target Balance

Before SMOTE — check class distribution

In [24]:
```
from imblearn.over_sampling import SMOTE
from collections import Counter
X = df.drop(columns=["Heart Attack Risk"])
y = df["Heart Attack Risk"]
X = pd.get_dummies(X, drop_first=True)
print("Original class distribution:")
print(Counter(y))
plt.figure(figsize=(6,4))
sns.countplot(x=y, palette="pastel")
plt.title("Before SMOTE: Target Distribution")
plt.xlabel("Heart Attack Risk")
plt.ylabel("Count")
plt.show()
```

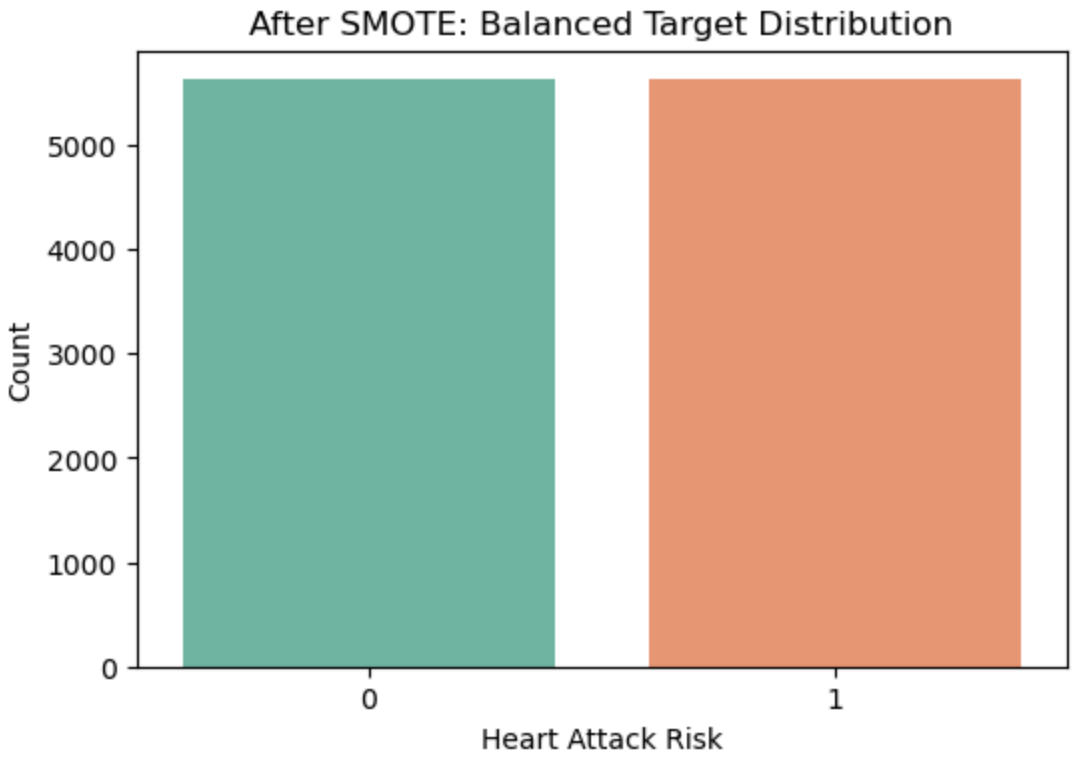
```
Original class distribution:
Counter({0: 5624, 1: 3139})
```



After SMOTE — check new balance

In [25]:
```
#  Apply SMOTE
smote = SMOTE(random_state=42)
X_res, y_res = smote.fit_resample(X, y)
print("\n After SMOTE class distribution:")
print(Counter(y_res))
plt.figure(figsize=(6,4))
sns.countplot(x=y_res, palette="Set2")
plt.title("After SMOTE: Balanced Target Distribution")
plt.xlabel("Heart Attack Risk")
plt.ylabel("Count")
plt.show()
```

```
 After SMOTE class distribution:
Counter({0: 5624, 1: 5624})
```



Create a new balanced DataFrame

In [26]:
```
df_balanced = pd.concat([pd.DataFrame(X_res), pd.Series(y_res, name="Heart Attack R
df_balanced
```

Out[26]:

Performing Feature Selection using Diffrent Methods of Selection on the New Dataframe and Training Diffrent Models with the Selected Features with Hyperparameter Tuning

importing Dependencies

In [27]:
```
# Imports
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split, GridSearchCV, StratifiedKFold
from sklearn.preprocessing import MinMaxScaler
from sklearn.feature_selection import SelectKBest, chi2, RFE, mutual_info_classif
from sklearn.linear_model import LogisticRegression, Lasso
from sklearn.tree import DecisionTreeClassifier
from sklearn.neighbors import KNeighborsClassifier
from catboost import CatBoostClassifier
from xgboost import XGBClassifier
from sklearn.metrics import accuracy_score, precision_score, recall_score, f1_score
```

```
import warnings
warnings.filterwarnings('ignore')
```

Preparing data for normalizing and traing

In [28]:
```
#  Split data
X = df_balanced.drop("Heart Attack Risk", axis=1)
y = df_balanced["Heart Attack Risk"]
scaler = MinMaxScaler()
X_scaled = pd.DataFrame(scaler.fit_transform(X), columns=X.columns)
X_train, X_test, y_train, y_test = train_test_split(X_scaled, y, test_size=0.2, str
```

Models Defination and Parameters for Tuning

In [29]:
```
models_params = {
    "LogisticRegression": (LogisticRegression(max_iter=2000), {
        "C": [0.01, 0.1, 1, 10],
        "solver": ["liblinear", "lbfgs"]
    }),
    "DecisionTreeClassifier": (DecisionTreeClassifier(random_state=42), {
        "max_depth": [3, 5, 10, None],
        "min_samples_split": [2, 5, 10],
        "criterion":['gini','entropy']
    }),
    "XGBoost": (XGBClassifier(use_label_encoder=False, eval_metric='logloss', rando
        "n_estimators": [100, 200],
        "learning_rate": [0.01, 0.1, 0.2],
        "max_depth": [3, 5, 7]
    }),

    })
 }
```

Defining Feature Selection Methods

In [30]:
```
feature_selectors = {}
# 1. Univariate (SelectKBest)
skb = SelectKBest(score_func=chi2, k=10)
skb.fit(X_scaled, y)
```

```
feature_selectors['SelectKBest'] = X_scaled.columns[skb.get_support()]
# 2. RFE with Logistic Regression
rfe = RFE(LogisticRegression(max_iter=1000), n_features_to_select=10)
rfe.fit(X_scaled, y)
feature_selectors['RFE'] = X_scaled.columns[rfe.support_]

# 3. DecisionTree Importance
dt = DecisionTreeClassifier(random_state=42)
dt.fit(X_scaled, y)
dt_features = X_scaled.columns[np.argsort(dt.feature_importances_)[-10:]]
feature_selectors['RandomForest_Importance'] = dt_features

# 4. L1 Regularization (Lasso)
lasso = Lasso(alpha=0.001, max_iter=10000)
lasso.fit(X_scaled, y)
lasso_features = X_scaled.columns[np.abs(lasso.coef_) > 1e-4]
feature_selectors['L1_Lasso'] = lasso_features

# 5. Mutual Information
mi = mutual_info_classif(X_scaled, y)
mi_features = X_scaled.columns[np.argsort(mi)[-10:]]
feature_selectors['Mutual_Info'] = mi_features
```

Training and Evaluating Models

In [31]:

```
results = []
cv = StratifiedKFold(n_splits=5, shuffle=True, random_state=42)
for method, features in feature_selectors.items():
    print(f"\n Feature Selection: {method}")
    X_train_fs, X_test_fs = X_train[features], X_test[features]

    for name, (model, params) in models_params.items():
        print(f"Training {name} ...")
        grid = GridSearchCV(model, params, cv=cv, scoring='accuracy', n_jobs=-1)
        grid.fit(X_train_fs, y_train)
        best_model = grid.best_estimator_
        y_pred = best_model.predict(X_test_fs)
        acc = accuracy_score(y_test, y_pred)
        pre = precision_score(y_test, y_pred)
        recall = recall_score(y_test, y_pred)
        f1     = f1_score(y_test, y_pred)

        results.append({
            "Feature_Selection": method,
            "Model": name,
            "Best_Params": grid.best_params_,
            "Accuracy": acc,
            "Precision": pre,
